Markets Update: A Quarter in Review

First Quarter 2011

- Despite natural disasters in Japan and other countries, increased political turmoil in the Middle East and North Africa, and rising commodities prices, which could hamper the economic recovery in developed countries, equity markets around the world had good performance in the first quarter. The broad US market gained over 6%, with all asset classes delivering positive returns.
- The overall performance in other developed markets was also above average, although it was not nearly as good. As in most of the past few quarters, there was much dispersion in performance at the individual country level. Japan, which suffered the worst earthquake ever recorded there, a subsequent tsunami and nuclear crisis, had sharply negative returns for the quarter. At the other end of the spectrum, some of the worst performers from last year, such as Spain and Italy, were the top performers in the quarter. The US dollar lost ground against most major currencies except the yen, which helped the dollar-denominated returns of developed market equities.
- Emerging markets had subpar but positive returns and trailed developed markets in the quarter. As in developed markets, there was much dispersion in the performance of different emerging markets. Russia and other eastern European countries performed exceptionally well in the quarter. The US dollar also lost ground against the main emerging market currencies in the first quarter, which contributed positively to the dollar-denominated returns of emerging market equities.
- With the exception of small cap value stocks in the US, which underperformed small cap growth stocks, value stocks outperformed growth stocks across all market capitalization segments in the US, in other developed markets, and in emerging markets. Along the market capitalization dimension, small caps outperformed large caps in the US. Outside the US, small caps trailed large caps in other developed markets and greatly underperformed large caps in emerging markets.
- Most fixed income securities had flat or slightly negative returns in the quarter. Inflation-protected securities, which had very strong returns, were the main exception.
- Real estate securities had strong returns in the first quarter and good performance relative to other asset classes.

US Large Cap Stocks (S&P 500)
US Small Cap Stocks (Russell 2000)
US Large Value Stocks (Russell 1000 Value)
International Developed Stocks (MSCI World ex USA)
Emerging Markets Stocks (MSCI Emerging Markets)
Real Estate (Dow Jones US Select REIT)
One-Month US Treasury Bills
Long-Term Corporate Bonds

The lack of a pattern indicates that picking which asset classes will be the best or worst performers is virtually impossible.

In Q4 2008, for example, the MSCI Emerging Markets Index was the second worst-performing asset class. A quarter later, it was the best-performing asset class.

Portfolios combining these various investments will avoid extreme returns.

Is It Different This Time?

First Quarter 2011

The 2008 global market crisis and the struggling economy have left many investors fatigued. Despite two years of strong equity returns, some investors have been slow to regain market confidence. Many are accepting the talk about a “new normal” in which stocks offer lower returns in the future. The concept of a new normal is anything but new. In fact, throughout history, periods of economic upheaval and market volatility have led people to assume that life had somehow changed and that new economic rules or an expanding government would limit growth. Let’s look at a couple of periods when investors had strong reasons to give up on stocks, and consider the parallels to today.

1932: The US stock market had just experienced four consecutive years of negative returns. A 1929 dollar invested in stocks was worth only 31 cents by the end of 1932. Hopes were sinking during the Great Depression, and many people felt as though the economy had permanently changed. Many investors left the market, and some would not return for a generation. Amidst what is considered the roughest economic time in US history, the markets looked ahead to recovery.

US Stock Market Performance after 1932*

	5 Years	10 Years	20 Years
Annualized Return	15.35%	10.07%	13.19%
Growth of \$1	\$ 2.04	\$ 2.61	\$ 11.92

1974: Investors had just experienced the worst two-year market decline since the early 1930s, and the economy was entering its second year of recession. The Middle East war had triggered the Arab oil embargo in late 1973, which drove crude oil prices to record levels and resulted in price controls and gas lines. Consumers feared that other shortages would develop. President Nixon had resigned from office in August over the Watergate scandal. Annual inflation in 1974 averaged 11%, and with mortgage rates at 10%, the housing market was experiencing its worst slump in decades. With prices and unemployment rising, consumer confidence was weak and many economists were predicting another depression.

US Stock Market Performance after 1974*

	5 years	10 years	20 years
Annualized Return	17.29%	15.92%	14.89%
Growth of \$1	\$ 2.22	\$ 4.38	\$ 16.07

The market slide that began in 2008 reversed in February 2009—gaining 83.3% from March 2009 through 2010. Despite two years of strong stock market returns, memories of the 2008 bear market and talk of the “lost decade” have led many investors to question stocks as a long-term investment. But earlier generations of investors faced similar worries—and today’s headlines echo the past with stories about government spending, surging inflation, deflationary threats, rising oil prices, economic stagnation, high unemployment, and market volatility.
